

Looking for keep more time the summary values as Service Transactions, Device Transactions, Service Latency, Activity Distribution.

Transactions details, and payload are the most spaces consuming we agree to look for a way to deleted it before or filter anyway on DPOD to be deleted before of the rest of information.

A preference way to delete transactions details in order to keep only for a predefined amount of days as retention time and **allow to keep for more days (as far there are available space on disk – as today work) the other summary values as Service Transactions**

Resources device keep more time than transactions, something like that is what we are looking for the data that IS NOT transaction or Payload.
