

Evidences for “Restricting users to view API Details in Portal site before signing in”

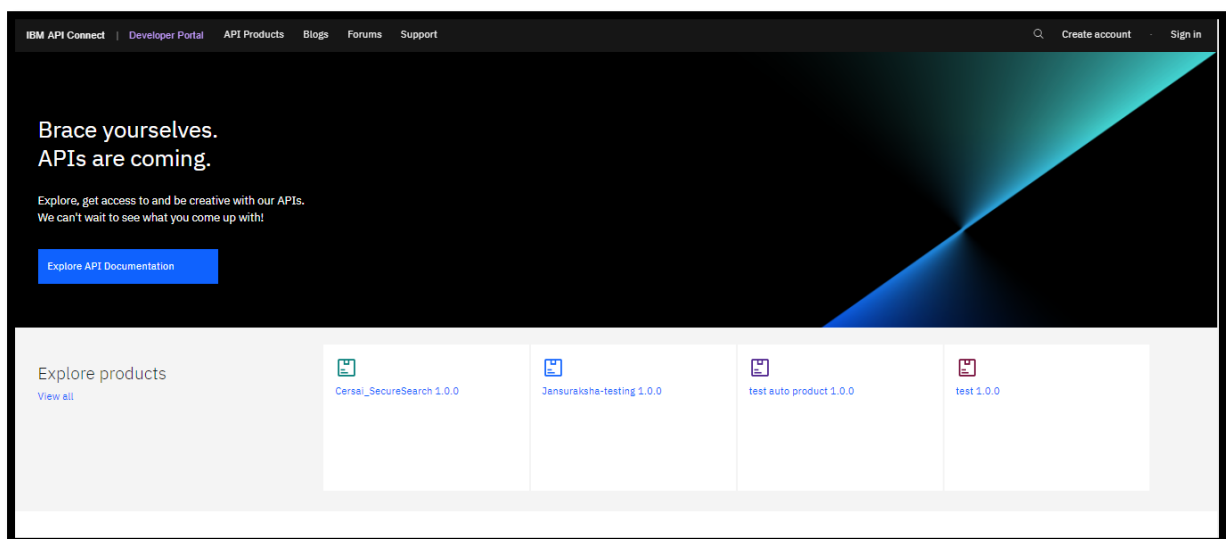

IOB Team to showcase all the APIs on the portal site, but when a user clicks on an API, the sign-in page should be prompted. No details like the endpoint, type, method, or security parameters should be shown without signing in. If a user clicks on a particular API, it should open the sign-in page.

But now it is prompting all the details when we click on the API name without signing into the portal site.

Screenshot 1: API Product Visibility: Public

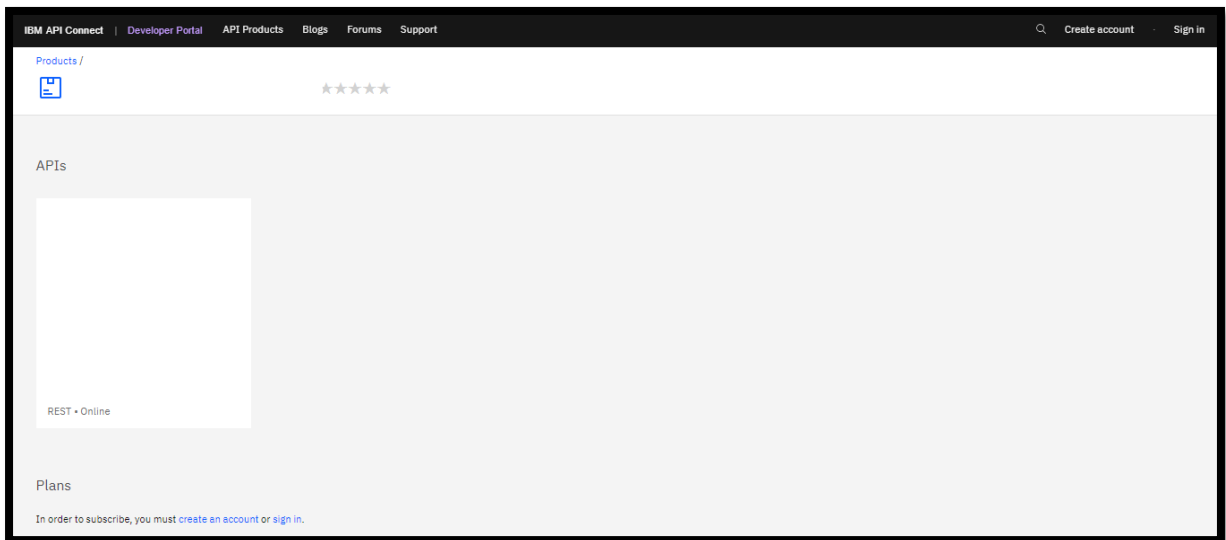

Screenshot 2: The APIs, which are published to this catalog, will be shown on the portal site before logging in to the site.

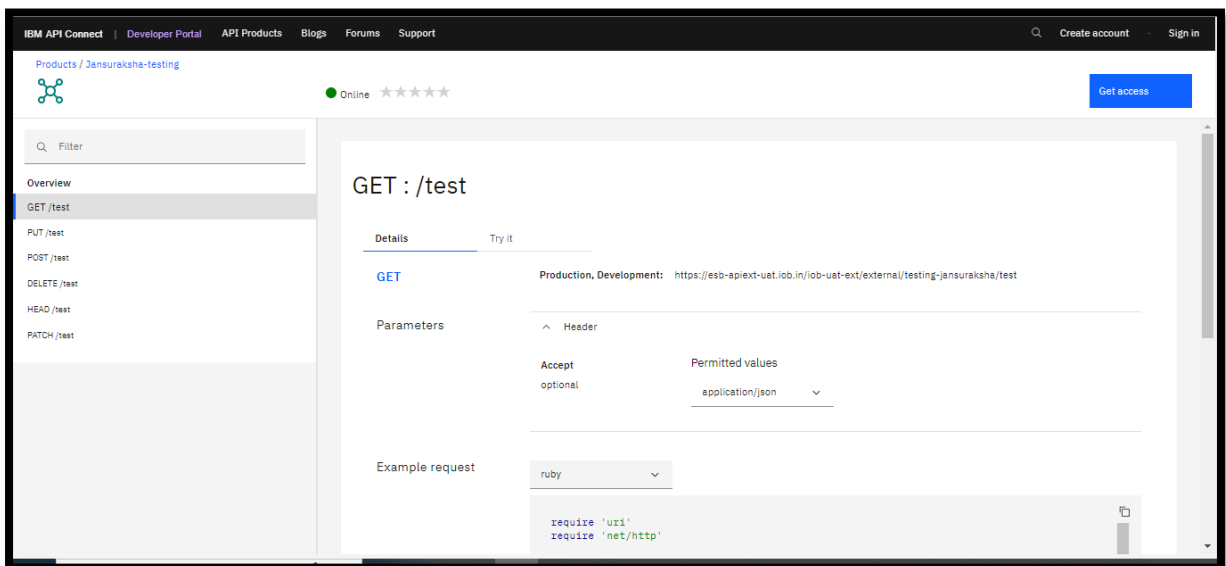

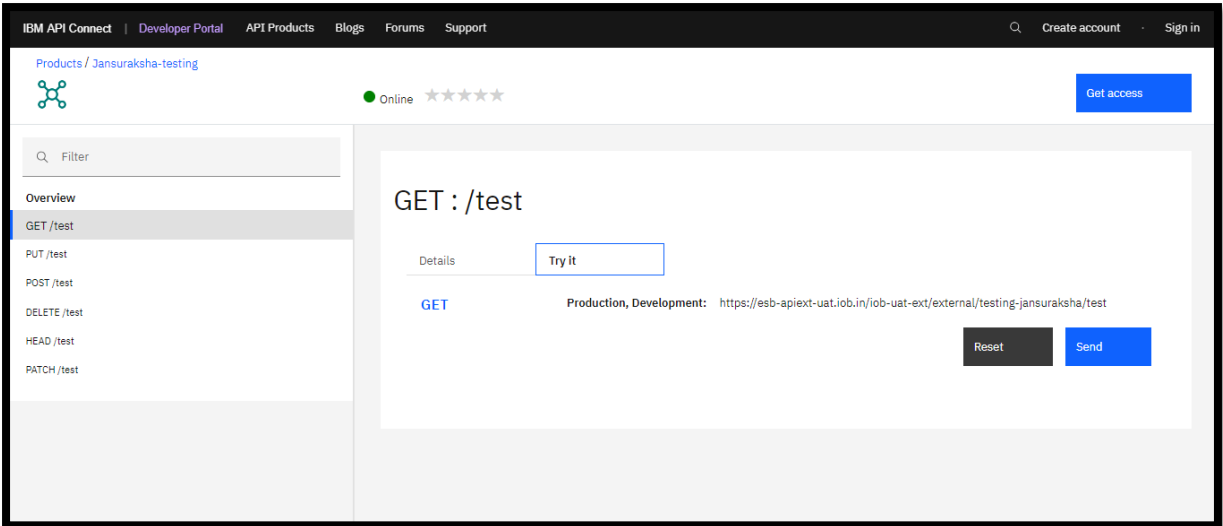

Screenshot 3: the APIs are shown without logging into portal site. For reference on the right side corner we can see the user is not logged in it asking for sign in.

Screenshot 4: After clicking on the product API is displayed.

Screenshot 5: After clicking on API the following, all the details are displayed.

With reference to the above screenshots we can see that all the API details are shown on the portal site if we select the visibility as public. But the bank team wants to restrict users to don't see the API details without signing in. When they click on API the sign in pop up should come.
